Learning Experience Plan
WEEK 2- LITERACY EXPERIENCE

Date of Implementation: November 20th,2025 Date shared with mentor: November 16th,2025

Art Experience		Sensory Experience	
Math/Science Experience		Literacy Experience	x
Storytelling Experience		Outside Experience	
Movement Experience		Other	

Observation/Documentation
Anecdote: During free play, Noah (c) pushed a toy train along the track. Mason (c) said, “Choo-choo!” as he moved it forward. Mason (c) placed another train behind his and said, “Mine is coming too.” The two children pushed their trains together, smiling as they made train sounds and moved around the track.

Interpretation
What were the child(ren) doing during the observation? The children were pushing toy trains along the track, making train sounds, and playing together by connecting their trains and moving them around the track. What skills were the child(ren) using? **- Fine motor skills:** pushing and guiding the toy trains along the track. **- Social skills:** playing alongside another child and joining play. **- Language skills:** using words and sound effects like “Choo-choo!” - **Imaginative play skills:** pretending the trains were moving and connected.
ELECT Age Category: Pre-school Domain: Cognitive and Language Root Skill: - Cognitive: Classification - Language and Literacy: Receptive Language Specific Indicator: - Sorts or groups objects by characteristics such as type, for example placing trains together or connecting them in a sequence. - Responds to verbal prompts during play, such as reacting when another child says, “Mine is coming too.” - Understands familiar words related to play (“train,” “coming”). - Imitates simple words and sound effects (“Choo-choo!”).

What were the child(ren) trying to accomplish? The children were trying to join their play by connecting their trains and moving them side by side.
Consider ways that this learning could be expanded or extended through the curriculum planning process. - Offer trains in different colors or sizes and invite children to sort them ("Can you find all the red trains?"). - Offer paper, crayons, and stickers for children to draw trains or create tickets.

Application
Learning Experience:
Describe the process of implementing this learning experience: To implement the Rainbow Rain in a Bottle activity, set up a clean table with paper towels and materials: a clear bottle, water, cooking oil, and food coloring. Pre-fill each bottle about 2/3 with water and prepare the colored oil. Gather the children in group of 5 and explain that they will observe "rainbow rain" forming inside the bottle. Slowly pour the colored oil into the water, allowing the drops to fall and create a rainbow effect. Encourage children to watch carefully, name the colors, and describe what they see, asking open-ended questions. After observation, discuss what happened and extend learning through drawing with additional colors. <u>Materials</u> - Clear bottle or jar (per group) - Water - Cooking oil - Food coloring (3–7 colors) - Sticks - Paper towels

Consider how this learning experience will be experienced by the various children in your group. What could you to make the experience more inclusive?
Children may engage with the Rainbow Rain activity in different ways depending on their abilities and interests. Some may enjoy closely observing the colors mix, while others may need support to focus or name the colors. To make the experience more inclusive, I can provide color cards and verbal cues, offer alternative ways to participate such as follow-up activities like drawing or painting the rainbow so all children can engage according to their strengths.

Reflection	
Description: Describe what happened in this learning experience.	During the activity, the children gathered around the table and watched closely as the coloured oil slowly dropped into the water inside the bottle. Many children became excited when they saw the colours sinking and creating the "rainbow rain" effect. Some children named the colours immediately, while others pointed and used gestures. The children asked questions like "Can we add more colours?"

	After observing, they colored pictures of the rainbow using crayons.
Feelings: What were you thinking and feeling during this experience.	I felt excited and encouraged seeing how curious the children were. At the beginning, I was a little nervous about managing the materials and keeping the children focused, but as the activity progressed, I felt more confident because the children were fully engaged. I felt happy watching them explore and communicate with each other.
Evaluation: What worked well with this experience? What did not work as planned? (Consider: materials, time, interactions, etc.)	**What worked well:** - The visual effect of the coloured droplets captured the children's attention immediately. - The children were eager to participate, name colours, and share their ideas. - The follow-up painting activity helped extend the learning. **What didn't work as planned:** - A few children finished observing quickly and lost focus, so I needed additional prompts to keep them engaged.
Analysis: What was the difference between what was planned and what actually happened?	I planned for the children to observe quietly first and then discuss, but instead many children started talking right away and asked questions throughout the activity. I also expected children to remain seated the whole time, but a few moved around because they were excited. The learning still happened, just in a more interactive and energetic way than planned.
Conclusion/Action plans: How will you use this information moving forward?	Moving forward, I will prepare additional extension materials (colour cards or small cups of coloured water) for children who need extra stimulation while waiting. I will also plan for more open-ended questions to support children's curiosity and conversations during the activity. Next time, I want to give children a chance to pour or mix the colours themselves to increase engagement and ownership.
