Learning Experience Plan
WEEK 3- MATH/ SCIENCE EXPERIENCE

Date of Implementation: November 23rd ,2025 Date shared with mentor: November 26th, 2025

Art Experience		Sensory Experience	
Math/Science Experience	x	Literacy Experience	
Storytelling Experience		Outside Experience	
Movement Experience		Other	

Observation/Documentation
Anecdote: During rest time, Adalynn (ch) quietly looked at the picture book and pointed to the animals on the page. She (ch) scrunched up her face when she (ch) saw the spider and said, “Ew! I don’t like that one.” A few pages later, she giggled at a picture of a rainbow and said, “Look! So many colours!” She named the colours she recognized and described what she saw, staying engaged and interested throughout the story.

Interpretation
What were the child(ren) doing during the observation? During the observation, Adalynn was actively looking at and interacting with the picture book. She was observing the images, reacting to things she liked or didn’t like (scrunching her face at the spider), pointing to objects, naming colours, describing what she saw, and expressing her emotions through giggling. She was fully engaged in exploring the story and making connections with the pictures. What skills were the child(ren) using? - Observation skills: noticing details in the pictures, such as the spider and the rainbow. - Language and communication skills: naming colours, describing what she saw, and expressing her opinions (Ew! I don’t like that one). - Emotional awareness: showing her feelings through facial expressions and giggling. - Cognitive skills: making connections between images and their meanings, recognizing familiar colours and differentiating between things she likes and dislikes. - Fine motor skills: pointing to the images in the book as she talked about them.
ELECT Age Category: Pre-school Domain: - Cognitive - Language and Communication - Social-Emotional Root Skill: Observation and Communication Specific Indicator: - Point to objects or images in a book while talking about them.

- Name colours she recognizes. - Express likes and dislikes clearly
What were the child(ren) trying to accomplish? During the observation, Adalynn was trying to understand and make sense of the story and illustrations by looking closely at the pictures and noticing details. She was also expressing her thoughts and feelings, communicating what she liked or didn't like, and identifying colours and objects in the book. Overall, she was actively engaging with the story, staying focused, and participating in the reading experience.
Consider ways that this learning could be expanded or extended through the curriculum planning process. - This learning could be extended by asking children to talk more about the pictures in the book, describe what they see, and name the colours or objects they notice. They could compare different animals or scenes in the story, or share their own experiences related to what they see in the book. I can also ask simple questions like "What do you think happens next?" to encourage children to think, predict, and use language skills. These activities help children stay engaged, practise communication, and make connections between the story and their own observations …

Application
Learning Experience:
Describe the process of implementing this learning experience: I will read *the story "Little Frog"* tells the story of a tiny tadpole that grows into a happy, hoppy frog, introducing children to the frog life cycle from egg → tadpole → froglet → adult frog. Building on this story, children can explore math and science through hands-on activities: in the Jumping Frog Count activity, they push plastic frogs' back legs to make them jump, then count and compare distances, developing counting, number recognition; in the Frog Life Cycle Cards activity, children sequence cards showing egg, tadpole, froglet, and frog, learning about growth and change, practicing observation and building science vocabulary. <u>Materials</u> - Plastic jumping frogs - 4 Life Cycle Cards: egg → tadpole → froglet → frog - *"Little Frog"* book

Consider how this learning experience will be experienced by the various children in your group. What could you to make the experience more inclusive?
This learning experience can be made inclusive by offering different ways for children to take part. Some children can push the jumping frogs on the floor, while others can count jumps, place life cycle cards in order, or observe and describe what happens. Sensory experiences, such as touching the frog toys allows children to engage using their own strengths. Working in pairs or small groups also encourages turn-taking, cooperation, and ensures that all children can participate and learn at their own pace.

Reflection	
Description: Describe what happened in this learning experience.	During the activity, the children were excited to try the jumping frogs. Some children pressed the frogs easily, while others needed help to make them jump.

	They laughed and watched where the frogs landed. When we moved to the life cycle cards, the children looked at the pictures and tried to put the stages in order. Some could do it on their own, and others needed a little support.
Feelings: What were you thinking and feeling during this experience.	I felt happy seeing the children enjoy the frog activity. I also felt patient and focused while helping the children who needed extra support, especially with making the frogs jump and understanding the life cycle order.
Evaluation: What worked well with this experience? What did not work as planned? (Consider: materials, time, interactions, etc.)	*What worked well:* - The frog toys kept the children engaged. - The life cycle cards helped them look closely at the pictures and talk about what they saw. - The children stayed interested through the whole activity. *What didn't work as planned:* - Some children could not press the frogs hard enough to make them jump. - Many children had difficulty understanding the order of the life cycle and needed more guidance. - The activity took longer than expected because they wanted more turns with the frogs.
Analysis: What was the difference between what was planned and what actually happened?	I planned for the children to explore the frog toys and learn about the life cycle. They enjoyed both parts, but they needed more support than I expected, especially with the life cycle. I thought the sequencing cards would be quicker, but the children spent more time looking at the pictures and needed extra help.
Conclusion/Action plans: How will you use this information moving forward?	Next time, I will choose frog toys that are easier for the children to press or offer another way for them to explore movement. I will also prepare a clear and simple visual of the frog life cycle because many children had difficulty understanding the order. I will plan extra time for hands-on activities since the children were very engaged and wanted to keep exploring at their own pace.
